

BUSINESS CASE	
Proposed Project	Group Leader Group Commitment Scheduling Website
Date Produced	Sept 17, 2026
Background	Planning with groups can be difficult, everyone has their own unique schedules, and figuring out a gap that's free can become frustrating when people keep ending up saying that time won't work. Because of this, visual aids tend to make planning far easier, because the trial and error aspect of planning can be replaced with looking at schedules and seeing if a timeslot works out. That being said, the current visual aids for this are either too specific or tedious to fill out.
Business Need/ Opportunity	Having a website that can allow for easy access to a visual aid for everyone's schedules is beneficial. Competitors seem to lack quality of life features such as - An option for a weekly schedule - Shared schedules between groups, so you only fill it once. - Focus on repeated weekly commitments, not one meeting. Group Leader fills this niche, by trying to minimize the amount of work it takes to fill out a schedule. This project supports convenience in the planning phases of a commitment, which can often be the hardest part.
Options	Option 1: Basic version of Group Leader Develop a version of Group Leader that does not allow for shared schedules, so as to not have proper accounts. This option focuses on safety by removing a feature that, while convenient, is not as necessary with only filling out one week's worth of plans for each group. In exchange, no identifiable data is used in the site. Option 2: Version of Group Leader including an Account system Develop a version of Group Leader that allows for shared schedules, requiring accounts to do so. This is a useful feature however may cause problems if there is a vulnerability in the website's design, so testing will become more important.
Cost-Benefit Analysis	
Option 1: Basic version of Group Leader Costs: - Time cost in designing, developing, and testing the schedule interface - Additional cost in web hosting - Users must enter their availability separately for each group they are in which makes the system less appealing for users involved with multiple groups Benefits:	

- Easier development timeline by avoiding user authentication
- Allows easier access for users by not needing to create an account
- Avoids storing account credentials thereby reducing privacy and security risks

Option 2: Version of Group Leader including an Account system

Costs:

- Time cost in designing, developing, and testing the schedule interface as well as account registration, login, and management systems
- Ongoing maintenance costs associated with account credential storage and security with a potential to hosting and database costs to increase
- Exposure to more stringent access requirements
- Users must create or log in to an account before accessing

Benefits:

- Allows users to update availability once and have it applied to all group scheduling requests
- Updates can be reflected across shared schedules, reducing scheduling conflicts and inconsistency
- Supports recurring weekly commitments, adding convenience and incentivization to repeat use

Recommendation

It is recommended to proceed with Option 2, the website with some form of shared scheduling. This option provides users with a quality of life feature, however, it will most likely require accounts in some way. This is a mild safety risk should consumers use identifiable data, but the end results will be worthwhile, and the safety risk will be fine if managed properly.
